

long COVID

Decision support for prediction and management of LCS

The Long COVID Project will unravel the mechanisms of host-virus response behind the long-term symptoms following COVID-19 infection. At the end of the project, the consortium aims to deliver a machine learning and AI-informed Long COVID prediction and decision support tool for the use of clinicians. This way, the Long COVID project will help in the identification of Long COVID and in the choice of personalised treatments for Long COVID patients.
